

32-3343: BOLA1 Recombinant Protein

Alternative Name : Bola-like protein 1,hBola,BOLA1,CGI-143.

Description

Source : Escherichia Coli. BOLA1 Human Recombinant produced in E.Coli is a single, non-glycosylated polypeptide chain containing 140 amino acids (21-137 a.a) and having a molecular mass of 14kDa. BOLA1 is fused to a 23 amino acid His-tag at N-terminus & purified by proprietary chromatographic techniques. Bola Homolog 1(BOLA1) is a member of the bolA/yrbA family. Bola proteins, which include the: hBola1, hBola2, and hBola3, are novel non-classical secreted proteins detected with bioinformatics and molecular biology experiments. The 3 Bola fusion proteins with c-Myc tag can be secreted into the culture medium of the transfected Cos-7 cells, even though they could not be colocalized with Golgi apparatus. Also, the secretion of 3 Bola proteins could not be inhibited after BFA treatment.
