## 32-3418: CAPSL Recombinant Protein

**Alternative Name:** Calcyphosine-like protein, CAPSL, MGC26610.

## **Description**

Source: Escherichia Coli. CAPSL Human Recombinant produced in E.coli is a single, non-glycosylated polypeptide chain containing 228 amino acids (1-208) and having a molecular mass of 26.3 kDa. The CAPSL is fused to a 20 amino acid His-Tag at N-terminus and purified by proprietary chromatographic techniques. CAPSL is a calcium-binding protein holding two conserved calcium-binding motifs (EF-hands) which are found in a superfamily of calcium sensors and calcium signal modulators. In addition, the CAPSL gene is in the same linkage disequilibrium (LD) block as the IL7R gene and there is well known association between the CAPSL-IL7R locus and type 1 diabetes.
