Description

14-3-3zeta is a central cellular hub protein regulating multiple signaling pathways involved in cancer development, progression and therapeutic resistance. It is linked to endoplasmic reticulum (ER) function in neurons, with reduced levels provoking ER stress and increasing vulnerability to excitotoxic injury. It is up-regulated in malignancy, which suggests its potential as a putative drug target for the treatment of colorectal cancer and tumorigenesis in pancreas, EOC (epithelial ovarian cancer).
