### Description

Source: Human Cells.  
MW :73.9kD.

Recombinant Human Interleukin-35 is produced by our Mammalian expression system and the target gene encoding Arg21-Lys229&Arg23-Ser219 is expressed with a Fc tag at the C-terminus. Interleukin-35 is a newest and potent suppressive cytokine of the IL-12 family. Unlike other members of the IL-12 family which are produced mainly by antigen-presenting cells (APCs), IL-35 has been identified as a potentially immunosuppressive cytokine primarily produced by regulatory T (Treg) cells, and to a lesser extent by activated dendritic cells and macrophages. IL-35 is composed of the IL-12 p35 subunit and the IL-27 Epstein-Barr virus-induced protein 3 (EBI3) subunit. IL-35 plays an important role in many disease models and has been recently shown to have additional functions aside from inhibition of proliferation, including inducing its own expression in non-Treg cells.
