Recombinant Mouse PDGF receptor alpha is produced by our Mammalian expression system and the target gene encoding Leu25-Glu524 is expressed with a 6His tag at the C-terminus. Platelet-derived growth factor receptors (PDGFR) are cell surface tyrosine kinase receptors for members of the platelet-derived growth factor (PDGF) family. The PDGF family consists of PDGF-A, -B, -C and -D, which form either homo- or heterodimers (PDGF-AA, -AB, -BB, -CC, -DD). The four PDGFs are inactive in their monomeric forms. PDGFs bind to the protein tyrosine kinase receptors PDGF receptor- α and - β . These two receptor isoforms dimerize upon binding the PDGF dimer, leading to three possible receptor combinations, namely - $\alpha\alpha$, - $\beta\beta$ and - $\alpha\beta$. PDGFRA and PDGFR β are members of the class III RTK family. Inappropriate PDGFRA and PDGFR β signaling has been linked to a number of proliferative disorders.
