Description

CD16 (FcgammaRIII) is a 50-65 kDa glycoprotein serving as a low affinity IgG receptor. Human FcgammaRIII is expressed in two forms - FcgammaRIII-A and -B. FcgammaRIII-A is a transmembrane protein of monocytes, macrophages, NK cells and a subset of T cells. It is associated with FcepsilonRI-gamma subunit and is responsible for antibody-dependent NK cell cytotoxicity. Mast cell FcgammaRIII-A is associated, moreover, with FcepsilonRI-beta subunit. Besides IgG, FcgammaRIII-A can be triggered also by oligomeric IgE. FcgammaRIII-B is a GPI-linked monomeric receptor expressed on neutrophils and is involved in their activation and induction of a proadhesive phenotype.

Application Note

Flow Cytometry *Recommended dilution:* 5-10 µg/ml

Positive control: PBL (peripheral blood lymphocytes)

Application note: The antibody MEM-154 does not react with CD16a present on NK cells in many subjects.

Immunoprecipitation Western Blotting *Application note:* Non-reducing conditions. **Functional Application** The antibody MEM-154 blocks binding of human IgG to FcgammaRIII.
