## Description

Recognizes a protein of 75 kDa , identified as mu heavy chain of human immunoglobulins. It does not cross-react with alpha ( $\lg A$ ), gamma ( $\operatorname{lgG}$ ), epsilon ( $\lg \mathrm{E}$ ), or delta ( $\lg \mathrm{D}$ ), heavy chains, T-cells, monocytes, granulocytes, or erythrocytes. This MAb is useful in the identification of leukemias, plasmacytomas, and certain non-Hodgkin's lymphomas. The most common feature of these malignancies is the restricted expression of a single heavy chain class. Demonstration of clonality in lymphoid infiltrates indicates that the infiltrate is clonal and therefore malignant.
