

32-6283: SARS-CoV-2 Membrane Envelope Recombinant Protein

Description

SOURCE : Escherichia Coli ;

PHYSICAL APPEARANCE : Sterile Filtered clear solution.

A human infecting coronavirus (viral pneumonia) called 2019 novel coronavirus, 2019-nCoV was found in the fish market at the city of Wuhan, Hubei province of China on December 2019.

The 2019-nCoV shares an 87% identity to the 2 bat-derived severe acute respiratory syndrome 2018 SARS-CoV-2 located in Zhoushan of eastern China. 2019-nCoV has an analogous receptor-BD-structure to that of 2018 SARS-CoV, even though there is a.a. diversity so thus the 2019-nCoV might bind to ACE2 receptor protein (angiotensin-converting enzyme 2) in humans.

While bats are possibly the host of 2019-nCoV, researchers suspect that animal from the ocean sold at the seafood market was an intermediate host. RSCU analysis proposes that the 2019-nCoV is a recombinant within the viral spike glycoprotein between the bat coronavirus and an unknown coronavirus.

Product Info

Amount :	50 µg / 250 µg
Purification :	Protein is >90% pure as determined SDS-PAGE.
Content :	CoV-2 Membrane Envelope protein solution is supplied in 1x PBS.
Storage condition :	CoV-2 Membrane Envelope fusion Protein is shipped on ice packs. Upon arrival, Store at -20°C.
Amino Acid :	The E.Coli derived recombinant fusion protein contains the Coronavirus 2019 Full-Length Membrane and Envelope proteins, Wuhan-Hu-1 strain, having a Mw of 34.2 kDa fused to His tag at C-terminal.
