## 32-6283: SARS-CoV-2 Membrane Envelope Recombinant Protein

## **Description**

SOURCE: Escherichia Coli;

PHYSICAL APPEARANCE: Sterile Filtered clear solution.

A human infecting coronavirus (viral pneumonia) called 2019 novel coronavirus, 2019-nCoV was found in the fish market at the city of Wuhan, Hubei province of China on December 2019.

The 2019-nCoV shares an 87% identity to the 2 bat-derived severe acute respiratory syndrome 2018 SARS-CoV-2 located in Zhoushan of eastern China. 2019-nCoV has an analogous receptor-BD-structure to that of 2018 SARS-CoV, even though there is a.a. diversity so thus the 2019-nCoV might bind to ACE2 receptor protein (angiotensin-converting enzyme 2) in humans.

While bats are possibly the host of 2019-nCoV, researchers suspect that animal from the ocean sold at the seafood market was an intermediate host. RSCU analysis proposes that the 2019-nCoV is a recombinant within the viral spike glycoprotein between the bat coronavirus and an unknown coronavirus.

## **Product Info**

**Amount :**  $50 \mu g / 250 \mu g$ 

**Purification :** Protein is >90% pure as determined SDS-PAGE.

**Content:** CoV-2 Membrane Envelope protein solution is supplied in 1x PBS.

**Storage condition :** CoV-2 Membrane Envelope fusion Protein is shipped on ice packs. Upon arrival, Store at -20°C. **Amino Acid :** The E.Coli derived recombinant fusion protein contains the Coronavirus 2019 Full-Length

Membrane and Envelope proteins, Wuhan-Hu-1 strain, having a Mw of 34.2 kDa fused to His tag

at C-terminal.
