### Description

PODXL is a highly glycosylated sialomucin, which is expressed in many types of tumors, as well as it is a well known marker of embryonic stem cells. Overexpression of PODXL is an independent predictor of cancer progression, metastasis, and poor outcome. PODXL promotes tumor growths and invasiveness, and is a potential target for antibody therapy.

**Specificity :** The mouse monoclonal antibody PcMab-47 recognizes a glycosylation-dependent epitope (aa 207-210) on human PODXL, a highly glycosylated transmembrane glycoprotein expressed above all in many types of cancer tissues, and on embryonic stem cells.
